Why We Decided to Make ClickSimple?

In today's world, websites and online tools have become a big part of our daily life. From filling out forms to getting information and booking services, we use them for simple tasks. We noticed that not everyone finds these tools easy to use. Confusing designs, technical terms and language problems can make even simple jobs hard especially for people who don't know much about technology.

As we looked at the hackathon challenge "Turn Interfaces Into Guided Tasks" we wanted to make a tool that could help people understand technology better. We believed that of making users change how they work we could create something that helps websites become easier for users.

This led us to create "ClickSimple", a browser extension that helps users when they are on websites. It helps users find information, fill out forms, move around pages and understand how to finish different tasks. We also added language choices so that people from different language backgrounds can use it more easily.

We decided to build a browser extension because it gives help directly on the website, without making them move to different pages.

Our reason for making ClickSimple was simple: technology should be available, to everyone no matter how much they know about it or what language they speak. With this project we want to make daily online experiences more welcoming and easier to use.
